

spidertracks

Lighter. Smarter. Better. The Spider S5.

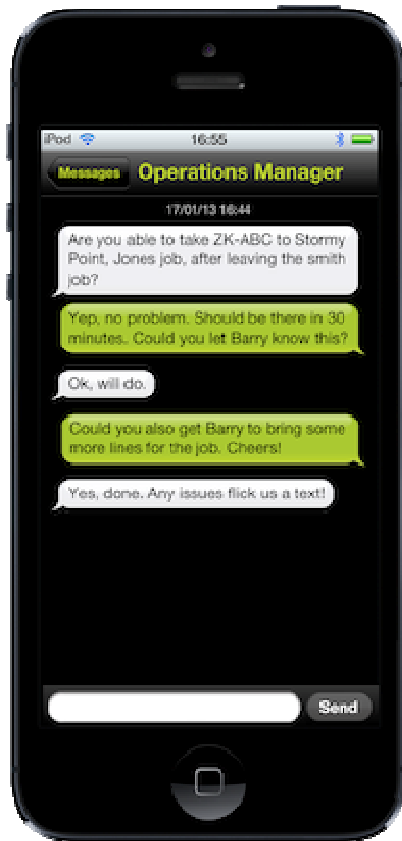

In the past, combining real-time flight tracking with two-way communication between aircraft and people on the ground required expensive hardware and even costlier installation certification. The Spider S5 is changing that.

By the spidertracks design team maintaining the compact shape of the Spider S3 and successfully integrating Bluetooth communication into the same size enclosure, you will get all the benefits of two-way messaging, SOS alerting, Watch, and customisable real-time flight tracking at a considerably lower price than other products in the market. As the Spider is considered portable under FAA regulations, no installation certification is required, reducing the cost advantage even more.

The Spidertxt update you have asked for!

You asked for it in the survey and we have listened. Spidertxt for iPhone®, iPod Touch® and the iPad® is here.

Adding to applications already available for Android and Blackberry, Spidertxt allows flight personnel to connect their smart phones to the Spider S4 and the newly released Spider S5 via a Bluetooth connection. Once connected, you can send and receive SMS messages from any mobile phone on the ground or from the spidertracks website through the Iridium Satellite Network.

Download the free application from the [App Store](#) for iPhone, iPod and iPad or the [Google Play](#) store for Android phones.

Please note, Spidertxt is not currently available on the new spidertracks website. Release of Spidertxt on this website is expected in mid 2013. iPad, iPhone, and iPod are trademarks of Apple Inc., registered in the U.S. and other countries. [Find out more...](#)

CONTACT US

We get so much positive feedback from our clients about spidertracks and how you really appreciate the system that we thought you might want to help spread the word! If you know of any pilots who you think would benefit from spidertracks, let

us know. Drop a line at info@spidertracks.co.nz.
